Re: Vertical Facial Dimensions Linked to Abnormal Foot Motion

ROTHBART's paper, which reports astonishing facts in a very condensed style, may shock certain readers ; it does not take into account the fact that many people are unaware of the developments of clinical Posturology in southern Europe. We must apologize for being much more interested in research and discoveries than in handling a language which is not ours; until now publications on clinical Posturology are written mostly in Latin and Slavic languages (see Ref.)... But Philippe VILLENEUVE and I can say that the facts reported by ROTHBART correspond to what we observe regularly in clinical posturology. A regulation of the postural tonic activity exists that it is worth knowing before criticizing articles on clinical Posturology in order to put the right statistical questions to their authors.
